IT Systems DevOps Engineer | Cologix

Cover letter

Hi Cologix team,

I like the part of DevOps that makes the next shift easier. At Front Range Internet, I ran the NOC and handled engineering escalations for hosting and colocation customers. When the same trouble kept coming back, I built diagnostics operators could use themselves and documented what to look for before escalating it. I also maintained our web services and built and replaced billing software, so I got to see firsthand how an internal tool can either save an operations team work or give them more of it.

At Technomancy IT, I own releases and operating support for client systems. I built a flow that tags container releases from Git and checks the container and the public endpoint separately. I also built a PostgreSQL backup checker that validates a checksum, restores into a disposable database, and checks table counts. A deploy command finishing and a service working aren't the same thing. I like building checks that make the difference visible.

What draws me to Cologix is the mix of internal engineering and hands-on operations. I'd bring the same habit: sit with the people who run the system, automate the parts they keep doing by hand, and leave them something they can troubleshoot and maintain.

Thanks,
Chad
